

FACULTY APPOINTMENT REQUEST SYSTEM

Project Report

Project Title	Faculty Appointment Request System
Technology Used	PHP, MySQL, HTML, CSS
Database	MySQL
Hosting Platform	InfinityFree
Project Type	Web-based Application

1. Introduction

The Faculty Appointment Request System is a web-based application developed to simplify the process of requesting appointments with faculty members. Students can submit appointment requests by entering their personal details, selecting a faculty member, choosing a date and time, and providing the purpose of the meeting. The administrator can view all requests and update their status.

2. Problem Statement

In a traditional appointment process, students may need to visit faculty rooms, make phone calls, or maintain manual records. This process can be time-consuming and may cause confusion regarding appointment schedules and request status. The proposed system provides a centralized and organized online solution.

3. Objectives

- To provide an online platform for students to request faculty appointments.
- To reduce manual appointment management.
- To store appointment details in a database.
- To allow administrators to approve, reject, or complete requests.
- To allow students to check request status.

4. Scope of the Project

The system is designed for colleges, departments, and educational institutions. Students can submit requests and check their status. Faculty or administrators can manage appointment records through an admin dashboard.

5. Technologies Used

HTML is used for webpage structure. CSS is used for styling. PHP is used for server-side processing and form handling. MySQL stores faculty and appointment data. InfinityFree is used for online hosting and deployment.

6. Main Modules

1. Home Page
2. Appointment Request Module
3. Appointment Status Module

4. Admin Login Module
5. Admin Dashboard
6. Database Module

7. Database Design

The appointments table contains id, student_name, student_email, faculty_id, appointment_date, appointment_time, purpose, status, and created_at. The faculty table stores faculty information such as id, name, department, email, phone, and availability. The faculty_id field connects appointments with the selected faculty member.

8. Working of the System

The student opens the home page and fills in the appointment form. The request is stored in MySQL. The administrator logs into the dashboard and views submitted requests. The administrator can change the status to Approved, Rejected, or Completed. The student can enter their email on the status page to view the updated status.

9. Advantages

- Saves time and effort.
- Reduces paperwork.
- Provides centralized records.
- Makes appointment tracking easy.
- Improves communication.

10. Limitations

The current version uses a basic admin login and email-based status checking. It does not yet include automatic email notifications, advanced authentication, or calendar synchronization.

11. Future Enhancements

Future improvements may include student login, faculty login, email notifications, calendar integration, appointment conflict checking, mobile responsiveness, automated reminders, and reporting features.

12. Conclusion

The Faculty Appointment Request System provides a simple and organized method for managing faculty appointment requests. It reduces manual work and allows students and administrators to track appointment information efficiently. The project demonstrates the practical use of PHP, MySQL, HTML, and CSS in a real-world web application.
